Liquid Shutoff Valve 25

Applications

The liquid shutoff valve is a three-way valve designed to rapidly shut off all liquid fuel flow and prevent leakage to the turbine. In the de-energized state, the valve diverts inlet flow to bypass ports, preventing pressure damage to positive displacement fluid systems.

Normal installation of the 45 lb (20 kg) valve is in the fuel line between the fuel regulating valve and the turbine.

The valve diverts flows from the discharge to bypass ports any time the operating electrical signal is lost. The valve is available in two voltage configurations.

The valve is designed for a normal operating supply pressure of up to 1200 psig (8274 kPa) and has a rated flow of 30 000 lb/h (13 608 kg/h) based on US MIL-C-7024 calibrating fluid at 70 °F (21 °C).

Description

The Woodward liquid shutoff valve is a two-stage valve. It uses supply pressure to provide a complete shut off of fuel flow in 0.09 seconds or less after termination of a solenoid current. Valve closure is due to spring compression assisted by supply pressure.

An inlet screen in the valve prevents contaminants in excess of 40 µm, nominal, from damaging the pilot valve section.

The valve housing is constructed of anodized aluminum. Hardened stainless steel is used for all internal parts. The valve is designed for proof pressures of 1800 psig (12 411 kPa) and burst pressures of 6000 psig (41 370 kPa).

An optional closed valve position switch is available.

- 30 000 lb/h (13 608 kg/h) rated flow
- Closes in 0.100 seconds
- 1200 psig (8274 kPa) maximum operating pressure
- Models are available with certification for North American Hazardous Locations
- Models are available compliant with the applicable CE Directives: ATEX, PED, and Machinery

GENERAL

Fuel Type
The valve is compatible with most types of diesels, kerosenes, gasolines, heavy and light distillates including naphtha, gas turbine fuels and fuel oils, and other liquid fuels such as biodiesel that are compatible with fluorocarbon (FKM) type elastomers and conform to international standards for utility, marine, and aviation gas turbine service. Ultra low sulfur diesels are also acceptable with proper lubricity additives. Other fuels such as ethanol or methanol may be acceptable with internal seal compound substitutions. Contact Woodward for these and other special fuel applications.

Fuel Viscosity
Fuel viscosity must be between 0.5 and 12.0 centistokes.

Fuel Cleanliness
Liquid fuel must be filtered to limit particulate size to 20 µm or smaller. Water and sediment must be limited to 0.1% by volume. Total particulate concentration must be limited to 2.64 mg per liter of fuel.

Fuel Temperature
0 to +250 °F (–18 to +120 °C)

Rated Flow
30 000 lb/h (13 608 kg/h) based on US MIL-C-7024 calibrating fluid at 70 °F (21 °C)

Cycle Life
10 000 cycles

Weight
45 lb (20 kg)

Construction
Anodized aluminum housing. Hardened stainless steel internal components

Fittings
Fuel inlet, fuel outlet, and bypass ports machined to accept –20 (SAE 070120) straight thread fittings

Electrical
0.500-14 NPTF conduit connector or M20-1.5 cable entries

OPERATING SPECIFICATIONS

Opening Time
Maximum of 0.400 seconds after admission of fuel and solenoid current
Within 0.100 seconds after the solenoid is de-energized with 100–1200 psig (690–8274 kPa) fuel applied to the inlet

Closing Time
Within 0.100 seconds after the solenoid is de-energized with 100–1200 psig (690–8274 kPa) fuel applied to the inlet

Pressure Drop
53 psid (365 kPa) inlet to discharge at 30 000 lb/h (13 608 kg/h)
139 psid (958 kPa) inlet to bypass at 30 000 lb/h (13 608 kg/h)

Internal Leakage Shutoff
From inlet to discharge: None
From inlet to bypass: 500 ccm maximum at 800 psid (5516 kPa)

Reverse Pressure Condition
900 psig (6206 kPa)
